Abstract of TW 482670 (B)

This device comprises a base adapted to be mounted on a recipient and comprising a bush forming an inner bore, and a plunger adapted to slide in this bore, between a first position, separate with respect to that stopper and a second, so-called transfer position, in which a hollow needle borne by or constituting said plunger passes through the stopper. The plunger and the base are formed in one piece and connected by at least one elastic tongue adapted to be deformed, essentially in a direction parallel to a central axis of the bore, to accompany the movement of the plunger between the afore-mentioned first and second positions.
